

# How to design XR Procedures

The XR Platform and MR Editor are both necessary to create rich XR Procedures. Switching between them is a must!

- XR Platform: add as many videos, pictures, text and details as is necessary for the training
- MR Editor: create spatial markers like arrows, highlights, etc. around your physical object that guide trainees during the training

## Using the XR Platform

### Note

Make sure you have the **Designer or Administrator** role. You can change roles by clicking on them and switch to another one in the list.

This is the **hierarchy** of projects, procedures and steps:

### Project

- **Procedure A**
  - **Step 1**
  - **Step 2**
  - **Step 3**
- **Procedure B**
  - **Step 1**

All the procedures you create are managed in projects. A project can hold multiple procedures. Procedures hold multiple steps to complete it.

## Create a project on the XR Platform
